

CEL Advancing Towards 75% Interest in Hualilan Gold Project

Highlights

- **CEL earns 25% interest in the Hualilan Gold project, under the Earn-in Agreements for Cerro Sur (including the 26km² surrounding EL) and Cerro Norte**
- **A minimum of A\$1 million spent on the Project, previously issued 3.34m CEL shares in 2019, now issuing a further 5m and 6.67m CEL shares (subject to escrow until 4 July 2021) to the owners of the Cerro Norte and Cerro Sur respectively**
- **CEL is committed to completing the remaining Earn-in Agreement milestones to increase its interest from 25% to 75%**
- **Of the 18 drill holes at the Hualilan Gold Project reported to date, all have intersected mineralisation, materially increasing known strike length to 2km**

Challenger Exploration Limited (ASX: CEL) (“CEL” or the “Company”) is pleased to announce that the Company has earned an initial 25% interest in the Hualilan Gold Project, under the Earn-in Agreements for Cerro Sur (including the 26km² surrounding the EL) and Cerro Norte. Challenger Exploration is committed to completing the remaining Earn-in Agreement Milestone, which will see the Company’s ownership increase from 25% to 75%, following the completion of a Definitive Feasibility Study within 5 years from commencement date, and the issue of a further 50 million ordinary full paid CEL shares to the owners of the Cerro Norte and Cerro Sur Projects.

Commenting on the 25% milestone, CEL Managing Director, Mr Kris Knauer, said

“We are pleased to have earned our initial 25% interest in the Hualilan Gold Project and are focused on moving to a 75% interest under the Earn in Agreement, before consolidating full 100% ownership of our flagship project.

The results from the first 18 holes have confirmed our view that Hualilan is a large high-grade gold system. We have another 31 drill holes in varying stages of assaying and sampling, and we look forward to releasing these results as they come to hand.

As our results show, not only is mineralisation at Hualilan open in all directions, we are continuing to find new zones of mineralisation as we drill. I firmly believe that to date, we have only just scratched the surface at the Hualilan Gold Project.”

Drill hole (#)	From (m)	Result (g/t AuEq)	Comments
GNDD-001	32.0	3.0m @ 2.6 g/t AuEq	new zone – supports a likely open pit at Cerro Norte

Inc	74.0	5.5m @ 30.3 g/t AuEq	the potential of structurally controlled high-grade shoots

Table 1: Summary Table of Hualilan Results to date

(1) AuEq grade calculated using (USD prices of) gold 1,450/oz, silver 16/oz, copper 5,610/t, lead 2,110/t and zinc 2,200/t. No metallurgical or recovery factors have been assumed at this early stage of the Project.

(2) For details of the foreign non-JORC compliant resource and to ensure compliance with LR 5.12 please refer to the Company's ASX Release dated 22 February 2019. These estimates are foreign estimates and not reported in accordance with the JORC Code. A competent person has not done sufficient work to clarify the foreign estimates as a mineral resource in accordance with the JORC Code. It is uncertain that following evaluation and/or further exploration work that the foreign estimate will be able to be reported as a mineral resource. The company is not in possession of any new information or data relating to the foreign estimates that materially impact on the reliability of the estimates that materially impacts on the reliability of the estimates or CEL's ability to verify the foreign estimates estimate as minimal resources in accordance with Appendix 5A (JORC Code). The company confirms that the supporting information provided in the initial market announcement on February 22, 2019 continues to apply and is not materially changed.

The Company has earned an initial 25% of the project by spending a minimum of A\$1 million, previously issuing 3.334 million ordinary full paid CEL shares in 2019, and a further 5 million ordinary fully paid CEL shares (“Shares”) to the owners of the Cerro Norte and 6.67 million Shares to the owners of the Cerro Sur Project.

The Company has received a waiver from the requirements of ASX Listing Rule 7.3.2, to enable it to complete the issue of the Earn-In Shares over a five-year period from the commencement date, rather than within the 3 months following the Meeting. These 11.67 million Shares to be issued under the Earn-in Agreement, were approved by shareholders on 29 April 2019 and will be subject to escrow until 4 July 2021.

Of the 18 drill holes at the Hualilan Gold Project reported by Challenger Exploration to date, all have intersected mineralisation, with the majority having materially extended the known mineralisation. This has resulted in the strike length of mineralisation now increasing to 2km, and the Company believes that the results, which are summarised in Table 1 of this announcement, demonstrate the potential for the project to have significant scale beyond the current Foreign Historical Resource estimate of 627,000 Ounces Gold Equivalent ⁽²⁾.

The current 7,500 metre drilling program is progressing as planned, with 40 drill holes (for 5,117 metres) completed to date (Table 2). CEL has submitted an additional 12 holes for assay, with the remaining 21 holes being logged and sampled for assay. CEL will replace the diamond core rig with a reverse circulation (RC) rig for the next 40-50 drill holes in the program, and the RC rig will allow CEL to complete the next holes more quickly and at significantly lower rates per metre drilled.

This ASX announcement was approved and authorised by the Board.

Table 2: Status of Hualilan Stage 2 drilling program

About Challenger Exploration

Challenger Exploration Limited's (ASX: CEL) aspiration is to become a globally significant gold producer. The Company is developing two complimentary gold/copper projects in South America. The strategy for the Hualilan Gold project is for it to provide a high-grade low capex operation in the near term. This underpins CEL with a low risk, high margin source of cashflow while it prepares for a much larger bulk gold operation in Ecuador.

- Hualilan Gold Project**, located in San Juan Province Argentina, is a near term development opportunity. It has extensive historical drilling with over 150 drill-holes and a non-JORC historical resource ⁽²⁾ of 627,000 Oz @ 13.7 g/t gold which remains open in most directions. The project was locked up in a dispute for the past 15 years and as a consequence had seen no modern exploration until CEL acquired the project in 2019. Results from CEL's first drilling program included ^(A) 6.1m @ 34.6 g/t Au, 21.9 g/t Ag, 2.9% Zn, 6.7m @ 14.3 g/t Au, 140 g/t Ag, 7.3% Zn and 10.3m @ 10.4 g/t Au, 28 g/t Ag, 4.6% Zn. This drilling intersected high-grade gold over almost 2 kilometres of strike and extended the known mineralisation along strike and at depth in multiple locations. CEL's 2020 program will include 7,500 metres of drilling, metallurgical test work of key ore types, and an initial JORC Compliant Resource which will allow an economic review.
- El Guayabo Project** covers 35 sqkms in southern Ecuador and was last drilled by Newmont Mining in 1995 and 1997 targeting gold in hydrothermal breccias. Historical drilling has demonstrated potential to host significant gold and associated copper and silver mineralisation. Historical drilling has returned a number of intersections of plus 100m of intrusion related breccia and vein hosted mineralisation. The Project has multiple targets including breccia hosted mineralization, an extensive flat lying late stage vein system and an underlying porphyry system target neither of which has been drill tested. CEL's first results confirm the discovery of large-scale gold system with over 250 metres of bulk gold mineralisation encountered in drill hole ZK-02 which contains a significant high-grade core of 134 metres at 1.0 g/t gold and 4.1 g/t silver including 63 metres at 1.6 g/t gold and 5.1 g/t silver

These estimates are foreign estimates and not reported in accordance with the JORC Code. A competent person has not done sufficient work to clarify the foreign estimates as a mineral resource in accordance with the JORC Code. It is uncertain that following evaluation and/or further exploration work that the foreign estimate will be able to be reported as a mineral resource. The company is not in possession of any new information or data relating to the foreign estimates that materially impact on the reliability of the estimates that materially impacts on the reliability of the estimates or CEL's ability to verify the foreign estimates estimate as minimal resources in accordance with Appendix 5A (JORC Code). The company confirms that the supporting information provided in the initial market announcement on February 22, 2019 continues to apply and is not materially changed.

Competent Person Statement – Exploration results

The information in this release provided under ASX Listing Rules 5.12.2 to 5.12.7 is an accurate representation of the available data and studies for the material mining project. The information that relates to sampling techniques and data, exploration results and geological interpretation has been compiled Dr Stuart Munroe , BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

Competent Person Statement – Foreign Resource Estimate

The information in this release provided under ASX Listing Rules 5.12.2 to 5.12.7 is an accurate representation of the available data and studies for the material mining project. The information that relates to Mineral Resources has been compiled by Dr Stuart Munroe , BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe and has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration to qualify as Competent Person as defined in the 2012 Edition of the JORC Code for Reporting of, Mineral Resources and Ore Reserves. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

JORC Code, 2012 Edition – Table 1 report template

Section 1 Sampling Techniques and Data -Hualilan Project

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary																																													
Sampling techniques	<ul style="list-style-type: none"> - Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. - Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. - Aspects of the determination of mineralisation that are Material to the Public Report. - In cases where ‘industry standard’ work has been done this would be relatively simple (eg ‘reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay’). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. 	<p>There is little information provided by previous explorers to detail sampling techniques. Drill core was cut with a diamond saw longitudinally and one half submitted for assay. Assay was generally done for Au. In some drill campaigns, Ag and Zn were also analysed. There is limited multielement data available. No information is available for RC drill sampling.</p> <p>For CEL drilling, diamond core (HQ3) was cut longitudinally on site using a diamond saw. Samples lengths are from 0.5m to 2.0m in length (average 1m), taken according to lithology, alteration, and mineralization contacts.</p> <p>Core samples were crushed to approximately 85% passing 2mm. A 500g or a 1 kg sub-sample was taken and pulverized to 85% passing 75µm. A 50g charge was analysed for Au by fire assay with AA determination. Where the fire assay gold grade returned was > 10 g/t a 50g charge was analysed for Au by Fire assay with gravimetric determination.</p> <p>A 10g charge was analysed for 48 elements by 4-acid digest and ICP-MS determination. Elements determined were Ag, As, Ba, Be, Bi, Ca, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Re, S, Sb Sc, Se, Sn, Sr, Ta, Te, Th, Ti, Tl, U, V, W, Y, Zn and Zr.</p> <p>Ag > 100 g/t, Zn, Pb and Cu > 10,000 ppm and S > 10% were re-analysed by the same method using a different calibration.</p> <p>Sample intervals were selected according to geological boundaries. There was no coarse gold observed in any of the core.</p>																																													
Drilling techniques	<ul style="list-style-type: none"> - Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc). 	<p>Collar details for historic drilling campaigns is provided below from archival data cross checked with drill logs and available plans and sections where available. Collars are in WGS84, zone 19s projection. DD is diamond drilling and RC is reverse circulation drilling. Collar locations have been surveyed in the field by CEL to verify if the site coincides with a marked collar or tagged drill site. In most cases the drill collars coincide with historic drill site, some of which are tagged.</p> <table border="1"> <thead> <tr> <th>Hole_id</th> <th>Type</th> <th>East (m)</th> <th>North (m)</th> <th>Elevation (m ASL)</th> <th>Azimuth (°)</th> <th>Dip (°)</th> <th>Depth (m)</th> <th>Date</th> </tr> </thead> <tbody> <tr> <td>AG01</td> <td>DD</td> <td>2504908.0</td> <td>6602132.3</td> <td>1807.6</td> <td>000</td> <td>-90</td> <td>84.5</td> <td>Jan-84</td> </tr> <tr> <td>AG02</td> <td>DD</td> <td>2504846.5</td> <td>6602041.1</td> <td>1803.4</td> <td>112</td> <td>-70</td> <td>60.0</td> <td>Jan-84</td> </tr> <tr> <td>AG03</td> <td>DD</td> <td>2504794.5</td> <td>6601925.6</td> <td>1803.1</td> <td>080</td> <td>-55</td> <td>110.0</td> <td>Jan-84</td> </tr> <tr> <td>AG04</td> <td>DD</td> <td>2504797.1</td> <td>6602065.5</td> <td>1806.6</td> <td>000</td> <td>-90</td> <td>168.0</td> <td>Jan-84</td> </tr> </tbody> </table>	Hole_id	Type	East (m)	North (m)	Elevation (m ASL)	Azimuth (°)	Dip (°)	Depth (m)	Date	AG01	DD	2504908.0	6602132.3	1807.6	000	-90	84.5	Jan-84	AG02	DD	2504846.5	6602041.1	1803.4	112	-70	60.0	Jan-84	AG03	DD	2504794.5	6601925.6	1803.1	080	-55	110.0	Jan-84	AG04	DD	2504797.1	6602065.5	1806.6	000	-90	168.0	Jan-84

CEL drilling of HQ3 core (triple tube) was done using a LM90 truck mounted drill machine that is operated by Foraco Argentina S.A. (Mendoza) and a trailer mounted Hydrocore drill machine operated by Energold Drilling (Mendoza). The core has not been oriented.

Collar details for drill holes completed by CEL are shown below in WGS84, zone 19s projection. Collar locations for drill holes after GNDD010 are surveyed with a handheld GPS:

Hole_id	East (m)	North (m)	Elevation (m)	Dip (°)	Azimuth (°)	Depth (m)

Drill sample recovery	<ul style="list-style-type: none"> - Method of recording and assessing core and chip sample recoveries and results assessed. - Measures taken to maximise sample recovery and ensure representative nature of the samples. - Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material. 	<p>Drill core is placed into wooden boxes by the drillers and depth marks are indicated on wooden blocks at the end of each run. These depths are reconciled by CEL geologists when measuring core recovery.</p> <p>Triple tube drilling has been being done to maximise core recovery.</p> <p>A possible relationship has been observed between sample recovery and Au Ag or Zn grade whereby low core recoveries have resulted in underreporting of grade. Insufficient information is not yet available to more accurately quantify this. Core recovery is influenced by the intensity of natural fracturing in the rock. A positive correlation between recovery and RQD has been observed. The fracturing is generally post mineral and not directly associated with the mineralisation.</p>																																																																																											
Logging	<ul style="list-style-type: none"> - Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation mining studies and metallurgical studies. - Whether logging is qualitative or quantitative in nature. Core (or costean channel etc) photography. - The total length and percentage of the relevant intersections logged. 	<p>Detailed logs are available for most of the historical drilling. Some logs have not been recovered. No core photographs from the historic drilling have been found. No drill core has survived due to poor storage and neglect. No RC sample chips have been found.</p> <p>For CEL drilling, all the core is logged for recovery RQD weathering lithology alteration mineralization and structure to a level that is suitable for geological modelling resource estimation and metallurgical test work. Where possible logging is quantitative. Geological logging is done in MS Excel in a format that can readily be transferred to a database which holds all drilling logging sample and assay data.</p>																																																																																											

Criteria	JORC Code explanation	Commentary
Sub-sampling techniques and sample preparation	<ul style="list-style-type: none"> - <i>If core whether cut or sawn and whether quarter half or all core taken.</i> - <i>If non-core whether riffled tube sampled rotary split etc and whether sampled wet or dry.</i> - <i>For all sample types the nature quality and appropriateness of the sample preparation technique.</i> - <i>Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.</i> - <i>Measures taken to ensure that the sampling is representative of the in-situ material collected including for instance results for field duplicate/second-half sampling.</i> - <i>Whether sample sizes are appropriate to the grain size of the material being sampled.</i> 	<p>Competent drill core is cut longitudinally using a diamond saw for sampling of ½ the core. Soft core is split using a wide blade chisel. The geologist logging the core indicates on the drill core where the saw cut is to be made to ensure half-core sample representivity.</p> <p>Sample intervals are selected based on lithology alteration and mineralization boundaries. Sample lengths average 1.16m. No second-half core samples have been submitted. The second half of the core samples has been retained in the core trays for future reference.</p> <p>The sample preparation technique is considered appropriate for the style of mineralization present in the Project.</p> <p>Sample sizes are appropriate for the mineralisation style and grain size of the deposit.</p>
Quality of assay data and laboratory tests	<ul style="list-style-type: none"> - <i>The nature quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.</i> - <i>For geophysical tools spectrometers handheld XRF instruments etc the parameters used in determining the analysis including instrument make and model reading times calibrations factors applied and their derivation etc.</i> - <i>Nature of quality control procedures adopted (eg standards blanks duplicates external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.</i> 	<p>The MSA laboratory used for sample preparation in San Juan has been inspected by Stuart Munroe (Exploration Manager) and Sergio Rotondo (Country Manager) prior to any samples being submitted. The laboratory procedures are consistent with international best practice and are suitable for samples from the Project. The ALS laboratory in Mendoza has not yet been inspected by CEL representatives.</p> <p>Internal laboratory standards were used for each job to ensure correct calibration of elements.</p> <p>CEL submit blank samples (cobble and gravel material from a quarry nearby to Las Flores San Yauan) to both the MSA laboratory and the ALS laboratory which were strategically placed in the sample sequence immediately after samples that were suspected of containing high grade Au Ag Zn or Cu to test the lab preparation contamination procedures. 21 blanks have been received from MSA laboratory and 18 blanks have been received from ALS laboratory. The values received from the blank samples suggest no significant contamination of the samples during sample preparation.</p> <p>For GNDD001 – GNDD010 three different Certified Standard Reference pulp samples (CRM) with known values for Au Ag Pb Cu and Zn have been submitted with samples of drill core to test the precision and accuracy of the analytic procedures and determination of the MSA laboratory in Canada. 22 reference samples were analysed in the samples submitted in 2019. For CRM 1 one sample returned an Au value > 2 standard deviations (SD) above the certified value. For CRM 2 one sample returned an Au value < 2SD below the certified value. For CRM 3 one sample returned a Cu value > 2SD above the certified value. All other analyses are within 2SD of the expected value. The standards demonstrate suitable precision and accuracy of the analytic process. No systematic bias is observed.</p> <p>For drill holes from GNDD011 onwards three different Certified Standard Reference pulp samples (CRM) with known values for Au Ag Fe S Pb Cu and Zn have been submitted with samples of drill core to test the</p>

Criteria	JORC Code explanation	Commentary
		precision and accuracy of the analytic procedures and determination of the ALS Laboratory in Canada. In the results received to date 30 CRM standards have been received from ALS Laboratory. In all cases the values returned have been within +/- 2SD of the mean value. The standards demonstrate suitable precision and accuracy of the analytic process. No systematic bias is observed.
Verification of sampling and assaying	<ul style="list-style-type: none"> - <i>The verification of significant intersections by either independent or alternative company personnel.</i> - <i>The use of twinned holes.</i> - <i>Documentation of primary data entry procedures data verification data storage (physical and electronic) protocols.</i> - <i>Discuss any adjustment to assay data.</i> 	<p>Significant intersections have not yet been independently verified by an alternative laboratory.</p> <p>Final analyses are received by digital file in PDF and CSV format. The original files are backed-up and the data copied into a drill hole database for geological modelling.</p> <p>Assay results summarised in the context of this report have been rounded appropriately. No assay data have been adjusted.</p>
Location of data points	<ul style="list-style-type: none"> - <i>Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys) trenches mine workings and other locations used in Mineral Resource estimation.</i> - <i>Specification of the grid system used.</i> - <i>Quality and adequacy of topographic control.</i> 	<p>Following completion of drilling collars are surveyed using a differential GPS (DGPS) relative into the Argentinian SGM survey. The locations have been surveyed in POSGAR 2007 zone 2 and converted to WGS84 UTM zone 19s.</p> <p>The drill machine is set-up on the drill pad using hand-held equipment according to the proposed hole design.</p> <p>Drill holes are surveyed at 30-40m intervals down hole using a Reflex tool.</p> <p>All current and previous drill collar sites Minas corner pegs and strategic surface points have been surveyed using DGPS to provide topographic control for the Project.</p>
Data spacing and distribution	<ul style="list-style-type: none"> - <i>Data spacing for reporting of Exploration Results.</i> - <i>Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.</i> - <i>Whether sample compositing has been applied.</i> 	<p>No regular drill hole spacing has been applied at this stage of the exploration. The current drilling is designed to check previous exploration and provide some information to establish controls on mineralization and exploration potential. No Mineral Resource Estimate to JORC 2012 reporting standards has been made at this time.</p> <p>Samples have not been composited.</p>
Orientation of data in relation to geological structure	<ul style="list-style-type: none"> - <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known considering the deposit type.</i> - <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias this should be assessed and reported if material.</i> 	<p>As far as is currently understood the orientation of sampling achieves unbiased sampling of structures and geology controlling the mineralisation.</p> <p>Drilling has been designed to provide an unbiased sample of the geology and mineralisation targeted.</p>

Criteria	JORC Code explanation	Commentary
Sample security	- <i>The measures taken to ensure sample security.</i>	Samples were under constant supervision by site security and senior personnel prior to delivery to the preparation laboratory in San Juan.
Audits or reviews	- <i>The results of any audits or reviews of sampling techniques and data.</i>	There has not yet been any independent reviews of the sampling techniques and data.

Mining Lease extensions (Demasias) at the Hualilan Project

Name	Number	Current Owner	Status	Grant date	Area (ha)
Cerro Sur					
North of "Pizarro" Mine	195-152-C-1981	Golden Mining S.R.L.	Granted	05/12/2014	1.9
Cerro Norte					
South of "La Toro" Mine	195-152-C-1981	CIA GPL S.R.L.	Granted	05/12/2014	1.9

Additional to the Minas and Demasias an application for an Exploration Licence covering 26 km² surrounding the 15 Minas has been accepted by the San Juan Department of Mines and is currently being processed.

Exploration licence application surrounding the Minas and Demasias at the Hualilan Project

Name	Number	Status	Grant Date	Expiry Date	Area (ha)
Josefina	30.591.654	Pending	-	5 year application	2570

There are no know impediments to obtaining the exploration license or operating the Project.

Exploration done by other parties - Acknowledgment and appraisal of exploration by other parties.

Intermittent sampling dating back over 500 years has produced a great deal of information and data including sampling geologic maps reports trenching data underground workings drill hole results geophysical surveys resource estimates plus property examinations and detailed studies by several geologists. Prior to the current exploration no work has been completed since 2006.

There is 6 km of underground workings that pass through mineralised zones. Records of the underground

Criteria	JORC Code explanation	Commentary
		<p>geology and sampling are currently being compiled and digitised as are sample data geological mapping trench data adit exposures and drill hole results. Geophysical surveys exist but have largely yet to be check located and digitised.</p> <p>Drilling on the Hualilan Project (Cerro Sur and Cerro Norte combined) extends to over 150 drill holes. The key historical exploration drilling and sampling results are listed below.</p> <ul style="list-style-type: none"> - 1984 – Lixivia SA channel sampling & 16 RC holes (AG1-AG16) totalling 2040m - 1995 - Plata Mining Limited (TSE: PMT) 33 RC holes (Hua- 1 to 33) + 1500 samples - 1998 – Chilean consulting firm EPROM (on behalf of Plata Mining) systematic underground mapping and channel sampling - 1999 – Compania Mineral El Colorado SA (“CMEC”) 59 core holes (DDH-20 to 79) plus 1700m RC program - 2003 – 2005 – La Mancha (TSE Listed) undertook 7447m of DDH core drilling (HD-01 to HD-48) - Detailed resource estimation studies were undertaken by EPROM Ltda. (EPROM) in 1996 and CMEC (1999 revised 2000) both of which were written to professional standards and La Mancha 2003 and 2006. - The collection of all exploration data by the various operators was of a high standard and had appropriate sampling techniques intervals and custody procedures were used.
Geology	- <i>Deposit type geological setting and style of mineralisation.</i>	<p>Mineralisation occurs in all rock types but it preferentially replaces limestone shale and sandstone and occurs in fault zones.</p> <p>The mineralisation has previously been classified as a Zn-Cu distal skarn (or manto-style skarn) with vein-hosted Au-Ag mineralisation. It has been divided into three phases – prograde skarn retrograde skarn and a late quartz–galena event the evolution of the hydrothermal system and mineral paragenesis is the subject of more detailed geometallurgical work.</p> <p>Gold occurs in native form in tellurides (hessite) and as inclusions with pyrite and chalcopyrite. The mineralisation also commonly contains chalcopyrite sphalerite and galena.</p> <p>Mineralisation is either parallel to bedding in bedding-parallel faults or in east-west striking steeply dipping siliceous quartz-dominated veins that cross the bedding at a high angle. The veins have thicknesses of 1–4 m and contain abundant sulphides. The intersection between the bedding-parallel mineralisation and east-striking cross veins seems to be important in localising the mineralisation.</p>
Drill hole Information	- <i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i>	<p>The following significant intersections have been reported by previous explorers. A cut-off grade of 1 g/t Au equivalent (calculated using a price of US\$1,300/oz for Au, \$15/oz for Ag and \$2,500/t. for Zn) has been used. No metallurgical or recovery factors have been used. Drill collar location is provided in the previous section.</p>

Data aggregation methods	<ul style="list-style-type: none"> - In reporting Exploration Results weighting averaging techniques maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. - Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. - The assumptions used for any reporting of metal equivalent values should be clearly stated. 	<p>Weighted average significant intercepts are reported to a gold grade equivalent. For GNDD001 – GNDD010 results are reported to cut-off grade of a 1.0 g/t Au equivalent allowing for up to 2m of internal waste between samples above the cut-off grade. The following metals and metal prices have been used to report gold grade equivalent: Au US\$ 1450 / oz Ag US\$16 /oz and Zn US\$ 2200 /t.</p> <p>For GNDD010 onwards results are reported to a cut-off grade of 1.0 g/t Au equivalent allowing for up to 2m of internal waste between samples above the cut-off grade. The following metals and metal prices have been used to report gold grade equivalent: Au US\$ 1450 / oz Ag US\$16 /oz Cu US\$ 5610/t Pb US\$ 2110/t Zn US\$ 2200 /t.</p> <p>No metallurgical or recovery factors have been applied to the metal equivalent grades as there has been insufficient work done at this stage of the exploration to establish these factors.</p> <p>No top cuts have been applied to the reported grades</p>																																																		
Relationship between mineralisation widths and intercept lengths	<ul style="list-style-type: none"> - These relationships are particularly important in the reporting of Exploration Results. - If the geometry of the mineralisation with respect to the drill hole angle is known its nature should be reported. - If it is not known and only the down hole lengths are reported there should be a clear statement to this effect (eg 'down hole length true width not known'). 	<p>The mineralisation is moderately or steeply dipping and strikes strike NNE and ENE. There is insufficient information in most cases to confidently establish the true width of the mineralized intersections at this stage of the exploration program.</p> <p>Apparent widths may be thicker in the case where bedding-parallel mineralisation may intersect ENE-striking cross faults and veins.</p>																																																		
Diagrams	<ul style="list-style-type: none"> - Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include but not be limited to a plan view of drill hole collar locations and appropriate sectional views. 	<p>Representative maps and sections are provided in the body of report.</p>																																																		
Balanced reporting	<ul style="list-style-type: none"> - Where comprehensive reporting of all Exploration Results is not practicable representative reporting of both low and high grades and/or widths should be 	<p>All available data have been reported.</p>																																																		

Criteria	JORC Code explanation	Commentary
	<i>practiced to avoid misleading reporting of Exploration Results.</i>	
Other substantive exploration data	<ul style="list-style-type: none"> - <i>Other exploration data if meaningful and material should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density groundwater geotechnical and rock characteristics; potential deleterious or contaminating substances.</i> 	<p>Geological context and observations about the controls on mineralisation where these have been made are provided in the body of the report.</p> <p>229 specific gravity measurements have been taken from the drill core recovered during the drilling program. These data are expected to be used to estimate bulk densities in future resource estimates.</p> <p>Eight Induced Polarisation (IP) lines have been completed in the northern area. Each line is approximately 1 kilometre in length lines are spaced 100m apart with a 50m dipole. The initial results indicate possible extension of the mineralisation with depth. Data will be interpreted including detailed re-processing and drill testing.</p>
Further work	<ul style="list-style-type: none"> - <i>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</i> - <i>Diagrams clearly highlighting the areas of possible extensions including the main geological interpretations and future drilling areas provided this information is not commercially sensitive.</i> 	<ul style="list-style-type: none"> • CEL Plans to undertake the following over the next 12 months <ul style="list-style-type: none"> • Additional data precision validation and drilling as required; • Detailed interpretation of known mineralized zones; • Geophysical tests for undercover areas. • Structural interpretation and alteration mapping using high resolution satellite data and geophysics to better target extensions of known mineralisation. • Field mapping program targeting extensions of known mineralisation. • Investigate further drilling requirements to upgrade both the unclassified mineralisation and mineralisation in the existing historical resources to meet JORC 2012 requirements; • Initial drill program comprising verification (twin holes) and targeting extensions of the historically defined mineralisation; • Metallurgical test work.

Section 3 Estimation and Reporting of Mineral Resources

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
Database integrity	<ul style="list-style-type: none"> - Measures taken to ensure that data has not been corrupted by for example transcription or keying errors between its initial collection and its use for Mineral Resource estimation purposes. - Data validation procedures used. 	<p>Geological logging completed by previous explorers was done on paper copies and transcribed into the drill hole database. The data was checked for errors. Checks can be made against the original logs and core photographs.</p> <p>Assay data is received in digital format. Backup copies are kept and the data is copied into the drill hole database.</p> <p>The drill hole data is backed up and is updated periodically by a Company GIS and data team.</p>
Site visits	<ul style="list-style-type: none"> - Comment on any site visits undertaken by the Competent Person and the outcome of those visits. - If no site visits have been undertaken indicate why this is the case. 	<p>Site visits have been undertaken from 3 to 16 October 2019 15 to 30 November 2019 and 1-19 February 2020. The performance of the drilling program collection of data and sampling procedures were initiated during these visits.</p>
Geological interpretation	<ul style="list-style-type: none"> - Confidence in (or conversely the uncertainty of) the geological interpretation of the mineral deposit. - Nature of the data used and of any assumptions made. - The effect if any of alternative interpretations on Mineral Resource estimation. - The use of geology in guiding and controlling Mineral Resource estimation. - The factors affecting continuity both of grade and geology. 	<p>The interpretation is considered appropriate given the stage of the project and the nature of activities that have been conducted. The interpretation captures the essential geometry of the mineralised structure and lithologies with drill data supporting the findings from the initial underground sampling activities.</p> <p>The most recent resource calculation (2006 and 2003 – La Mancha) used all core drilling at the time and detailed underground channel sampling collected by EPROM CMEC and La Mancha. Overlying assumptions included a reduction of the calculated grade in each resource block by a factor of 10% to account for possible errors in the analyses and samples. An arbitrary reduction factor was applied to the 2006 resource whereby the net reported tonnage was reduced by 25% for indicated resource blocks 50% for inferred resource blocks and 75% of potential mineral resource blocks. The reason for the application of these tonnage reduction factors was not outlined in the resource report. It is noted that at the time of this report La Mancha was in a legal dispute concerning the project with its joint venture partner and given the acquisition of a 200000 Oz per annum producing portfolio the project was likely no longer a core asset for La Mancha at that time. Additionally under the original acquisition agreement La Mancha had to issue additional acquisition shares based on resource targets.</p> <p>The effect of removing the assumptions relating to application of the arbitrary tonnage reduction factors applied increases the overall resource tonnage by in excess of 50%. Removing these correction factors would bring the overall tonnage and grade close the earlier (2003 1999 and 1996)</p>

Criteria	JORC Code explanation	Commentary
		<p>tonnage and grade estimates albeit in different categories (lower confidence) which are considered more appropriate.</p> <p>The mineralisation is defined to the skarn and vein bodies detailed cross section and plan maps were prepared for these bodies with their shapes used in controlling the resource estimate.</p> <p>The structure of the area is complex and a detailed structural interpretation is recommended as this may provide a better understanding of the continuity of mineralisation and possible extensions to it. The deposit contains bonanza gold values and while very limited twinning has indicated acceptable repeatability a rigorous study of grade continuity needs to be undertaken as part of future resource calculations.</p>
Dimensions	<ul style="list-style-type: none"> - <i>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise) plan width and depth below surface to the upper and lower limits of the Mineral Resource.</i> 	<p>For the historic resource no reliable information has been provided to the owner however through further ongoing investigation is being conducted by the owner to address this information gap.</p>
Estimation and modelling techniques	<ul style="list-style-type: none"> - <i>The nature and appropriateness of the estimation technique(s) applied and key assumptions including treatment of extreme grade values domaining interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</i> - <i>The availability of check estimates previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</i> - <i>The assumptions made regarding recovery of by-products.</i> - <i>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</i> - <i>In the case of block model interpolation the block size in relation to the average sample spacing and the search employed.</i> - <i>Any assumptions behind modelling of selective mining units.</i> - <i>Any assumptions about correlation between variables.</i> - <i>Description of how the geological interpretation was used to control the resource estimates.</i> - <i>Discussion of basis for using or not using grade cutting or capping.</i> - <i>The process of validation the checking process used the comparison of model data to drill hole data and use of reconciliation data if available</i> 	<p>The historic resource estimation techniques are considered appropriate. The 2003 and 2006 resources used a longitudinal section polygonal method was used for estimating resources with individual blocs representing weighted averages of sampled underground and/or areas of diamond drill pierce points with zones of influence halfway to adjacent holes. The area of the block was calculated in AutoCad directly from the longitudinal sections.</p> <p>Check assaying by PG Consulting returned values in the check assay sample which were 3.4% and 13% greater for Au and Ag than the original assays. A number pf previous resource estimates were available to check the 2006 resource estimate when the arbitrary tonnage reduction factors are removed brings the overall tonnage and grade close the earlier (2003 1999 and 1996) tonnage and grade estimates albeit indifferent categories which are considered more appropriate.</p> <p>It was assumed only gold silver and zinc would be recovered and that no other by products would be recovered. This is viewed as conservative given metallurgical data pointing to the production of a saleable zinc concentrate.</p> <p>Based on the preliminary metallurgy estimation of deleterious elements or other non-grade variables of economic significance was not required.</p> <p>The minimum mining width of 0.8m was assumed for veins less than 0.6m and for wider widths a dilution of 0.2m was used to calculate the grade.</p>

Criteria	JORC Code explanation	Commentary
		<p>No assumptions were made regarding correlation between variables.</p> <p>The mineralisation is defined within skarn and associated vein deposits. Detailed cross section and plan maps were prepared for these domains with their shapes used in controlling the resource estimate. Long sections of the veins and skarn were taken and sampling was plotted and the blocks outlined considering this.</p> <p>Grade cutting was not used in the calculation of the resource and no discussion was given as to why it was not employed. It is recommended that a study be undertaken to determine if an appropriate top cut need be applied</p> <p>No data is available on the process of validation.</p>
Moisture	- <i>Whether the tonnages are estimated on a dry basis or with natural moisture and the method of determination of the moisture content.</i>	No data is available.
Cut-off parameters	- <i>The basis of the adopted cut-off grade(s) or quality parameters applied.</i>	The Mineral Resource Estimate is above a cut-off grade of 3.89 g/t Au. This is based on the assumed mining cost at the time of the estimate.
Mining factors or assumptions	- <i>Assumptions made regarding possible mining methods minimum mining dimensions and internal (or if applicable external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case this should be reported with an explanation of the basis of the mining assumptions made.</i>	<p>The Mineral Resource Estimate considered the assumptions outlined below which are considered appropriate;</p> <ul style="list-style-type: none"> - Metal prices: Au US\$550 Oz Ag US\$10 Oz - Metallurgical Recovery; Au – 80% Ag – 70% Zn – nil - Operating cost: US\$55t based on underground cut and fill mining and flotation and cyanidation combined <p>The minimum mining width of 0.8m was assumed for veins less than 0.6m and for wider widths a dilution of 0.2m was used to calculate the grade.</p>
Metallurgical factors or assumptions	- <i>The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case this should be reported with an explanation of the basis of the metallurgical assumptions made.</i>	Historical metallurgical test-work is currently under review however the assumptions used (80% Au recovery 70% Ag and no zinc recovery) seem conservative. The most recent test work was conducted in 2000 and was a preliminary assessment only. This work was conducted at Lakefield Labs (cyanidation) and CIMM Labs (flotation) in Chile. While this work is preliminary it indicates recoveries for differential flotation in conjunction with a Knelson concentrator at 80% each for gold and silver and 50% for zinc regardless of the type of material (sulphide or oxidized).
Environmental factors or assumptions	- <i>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and</i>	It is considered that there are no significant environmental factors which would prevent the eventual extraction of gold from the project. Environmental surveys and assessments will form a part of future pre-feasibility.

Criteria	JORC Code explanation	Commentary
	<p><i>processing operation. While at this stage the determination of potential environmental impacts particularly for a greenfields project may not always be well advanced the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</i></p>	
Bulk density	<ul style="list-style-type: none"> - <i>Whether assumed or determined. If assumed the basis for the assumptions. If determined the method used whether wet or dry the frequency of the measurements the nature size and representativeness of the samples.</i> - <i>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs porosity etc) moisture and differences between rock and alteration zones within the deposit.</i> - <i>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</i> 	<p>Densities of 2.7 t/m3 were used for mineralised veins and 2.6 t/m3 for wall rock.</p> <p>No data of how densities were determined is available.</p> <p>The bulk densities used in the evaluation process are viewed as appropriate at this stage of the Project.</p> <p>CEL is collecting specific gravity measurements from drill core recovered in 2019 and 2020 drilling programs, which it is expected will be able to be used to estimate the block and bulk densities in future resource estimates.</p>
Classification	<ul style="list-style-type: none"> - <i>The basis for the classification of the Mineral Resources into varying confidence categories.</i> - <i>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations reliability of input data confidence in continuity of geology and metal values quality quantity and distribution of the data).</i> - <i>Whether the result appropriately reflects the Competent Person's view of the deposit.</i> 	<p>The Mineral Resource Estimate has both Indicated and Inferred Mineral Resource classifications under the National Instrument 43-101 code and is considered foreign. These classifications are considered appropriate given the confidence that can be gained from the existing data and results from drilling.</p> <p>The reliability of input data for the 2003 and 2006 resources is acceptable as is the confidence in continuity of geology and metal values quality quantity and distribution of the data. Appropriate account has been taken of all relevant factors with the exception of studies into the appropriateness of the application of a top cut.</p> <p>The reported 2006 NI43-101 (non-JORC Code compliant Measured and Indicated) estimate for the Hualilan Project is measured resource of 164294 tonnes averaging 12.6 grams per tonne gold and 52.1 g/t silver and 2.5% zinc plus an indicated resource of 51022 tonnes averaging 12.4 grams per tonne gold and 36.2 g/t silver and 2.6% zinc plus an inferred resource of 213952 tonnes grading 11.7 grams per tonne gold and 46.6 g/t silver and 2.3% zinc. (Source La Mancha resources Toronto Stock Exchange Release April 7 2007 - Interim Financials) – See Table 1.</p> <p>The 2006 estimate did not include the east-west mineralised Magnata Vein despite the known mineralisation in the Magnata Vein being drilled on a 25 x 50-metre spacing. The 2003 NI43-101 (non-JORC Code compliant) estimate attributed approximately half of its measured and indicated</p>

Criteria	JORC Code explanation	Commentary																																								
		<p>tonnage to the Magnata Vein. The 2006 estimate also included arbitrary tonnage reduction factors of 25% for indicated category 50% for inferred category and 75% for potential category.</p> <p>The 2006 estimate also included a significant tonnage of Potential Category Resources which have not been reported.</p> <p>The reported 2003 NI43-101 (non-JORC Code compliant) estimate for the Hualilan project is a measured resource of 299578 tonnes averaging 14.2 grams per tonne gold plus an indicated resource of 145001 tonnes averaging 14.6 grams per tonne gold plus an inferred resource of 976539 tonnes grading 13.4 grams per tonne gold representing some 647809 ounces gold. (Source La Mancha resources Toronto Stock Exchange Release May 14 2003 - Independent Report on Gold Resource Estimate) – See Table 1.</p> <p>The 2003 Mineral Resource classification and results appropriately reflect the Competent Person’s view of the deposit and the current level of risk associated with the project to date.</p> <p>Historic 2003 NI43-101 (non-JORC Code compliant):</p> <table border="1"> <thead> <tr> <th>CATEGORY</th> <th>TONNES</th> <th>Au (g/t)</th> <th>Ag (g/t)</th> <th>Zn%</th> </tr> </thead> <tbody> <tr> <td>Measured</td> <td>299578</td> <td>14.2</td> <td></td> <td></td> </tr> <tr> <td>Indicated</td> <td>145001</td> <td>14.6</td> <td></td> <td></td> </tr> <tr> <td>Inferred</td> <td>976539</td> <td>13.4</td> <td></td> <td></td> </tr> </tbody> </table> <p>Historic 2006 NI43-101 (non-JORC Code compliant)</p> <table border="1"> <thead> <tr> <th>CATEGORY</th> <th>TONNES</th> <th>Au (g/t)</th> <th>Ag (g/t)</th> <th>Zn%</th> </tr> </thead> <tbody> <tr> <td>Measured</td> <td>164294</td> <td>12.5</td> <td>52.1</td> <td>2.5</td> </tr> <tr> <td>Indicated</td> <td>51022</td> <td>12.4</td> <td>36.2</td> <td>2.6</td> </tr> <tr> <td>Inferred</td> <td>213952</td> <td>11.7</td> <td>46.6</td> <td>2.3</td> </tr> </tbody> </table>	CATEGORY	TONNES	Au (g/t)	Ag (g/t)	Zn%	Measured	299578	14.2			Indicated	145001	14.6			Inferred	976539	13.4			CATEGORY	TONNES	Au (g/t)	Ag (g/t)	Zn%	Measured	164294	12.5	52.1	2.5	Indicated	51022	12.4	36.2	2.6	Inferred	213952	11.7	46.6	2.3

Audits or reviews	- <i>The results of any audits or reviews of Mineral Resource estimates.</i>	<p>The historic resource estimate has not been audited.</p> <p>The earlier (1996 and 2000) Mineral Resource Estimates were audited and re-stated in a 2003 resource report. This independent report was done to NI-43-101 standard and the results of this</p>																																								

Criteria	JORC Code explanation	Commentary
		report were released to the TSX. This report concluded that “Detailed resource calculations made by three different groups are seen to be realistic.
Discussion of relative accuracy/ confidence	<ul style="list-style-type: none"> - Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits or if such an approach is not deemed appropriate a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate. - The statement should specify whether it relates to global or local estimates and if local state the relevant tonnages which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used. - These statements of relative accuracy and confidence of the estimate should be compared with production data where available. 	<p>There is sufficient confidence in the data quality drilling methods and analytical results that they can be relied upon. The available geology and assay data correlate well. The approach or procedure are deemed appropriate given the confidence limits. The main two factors which could affect relative accuracy is grade continuity and top cut.</p> <p>Grade continuity is variable in nature in this style of deposit and has not been demonstrated to date and closer spaced drilling is required to improve the understanding of the grade continuity in both strike and dip directions. It is noted that the results from the twinning of three holes by La Mancha are encouraging in terms of grade repeatability.</p> <p>The deposit contains very high grades and there is a potential need for the use of a top cut. It is noted that an arbitrary grade reduction factor of 10% has already been applied to the resource as reported.</p> <p>No production data is available for comparison</p>
